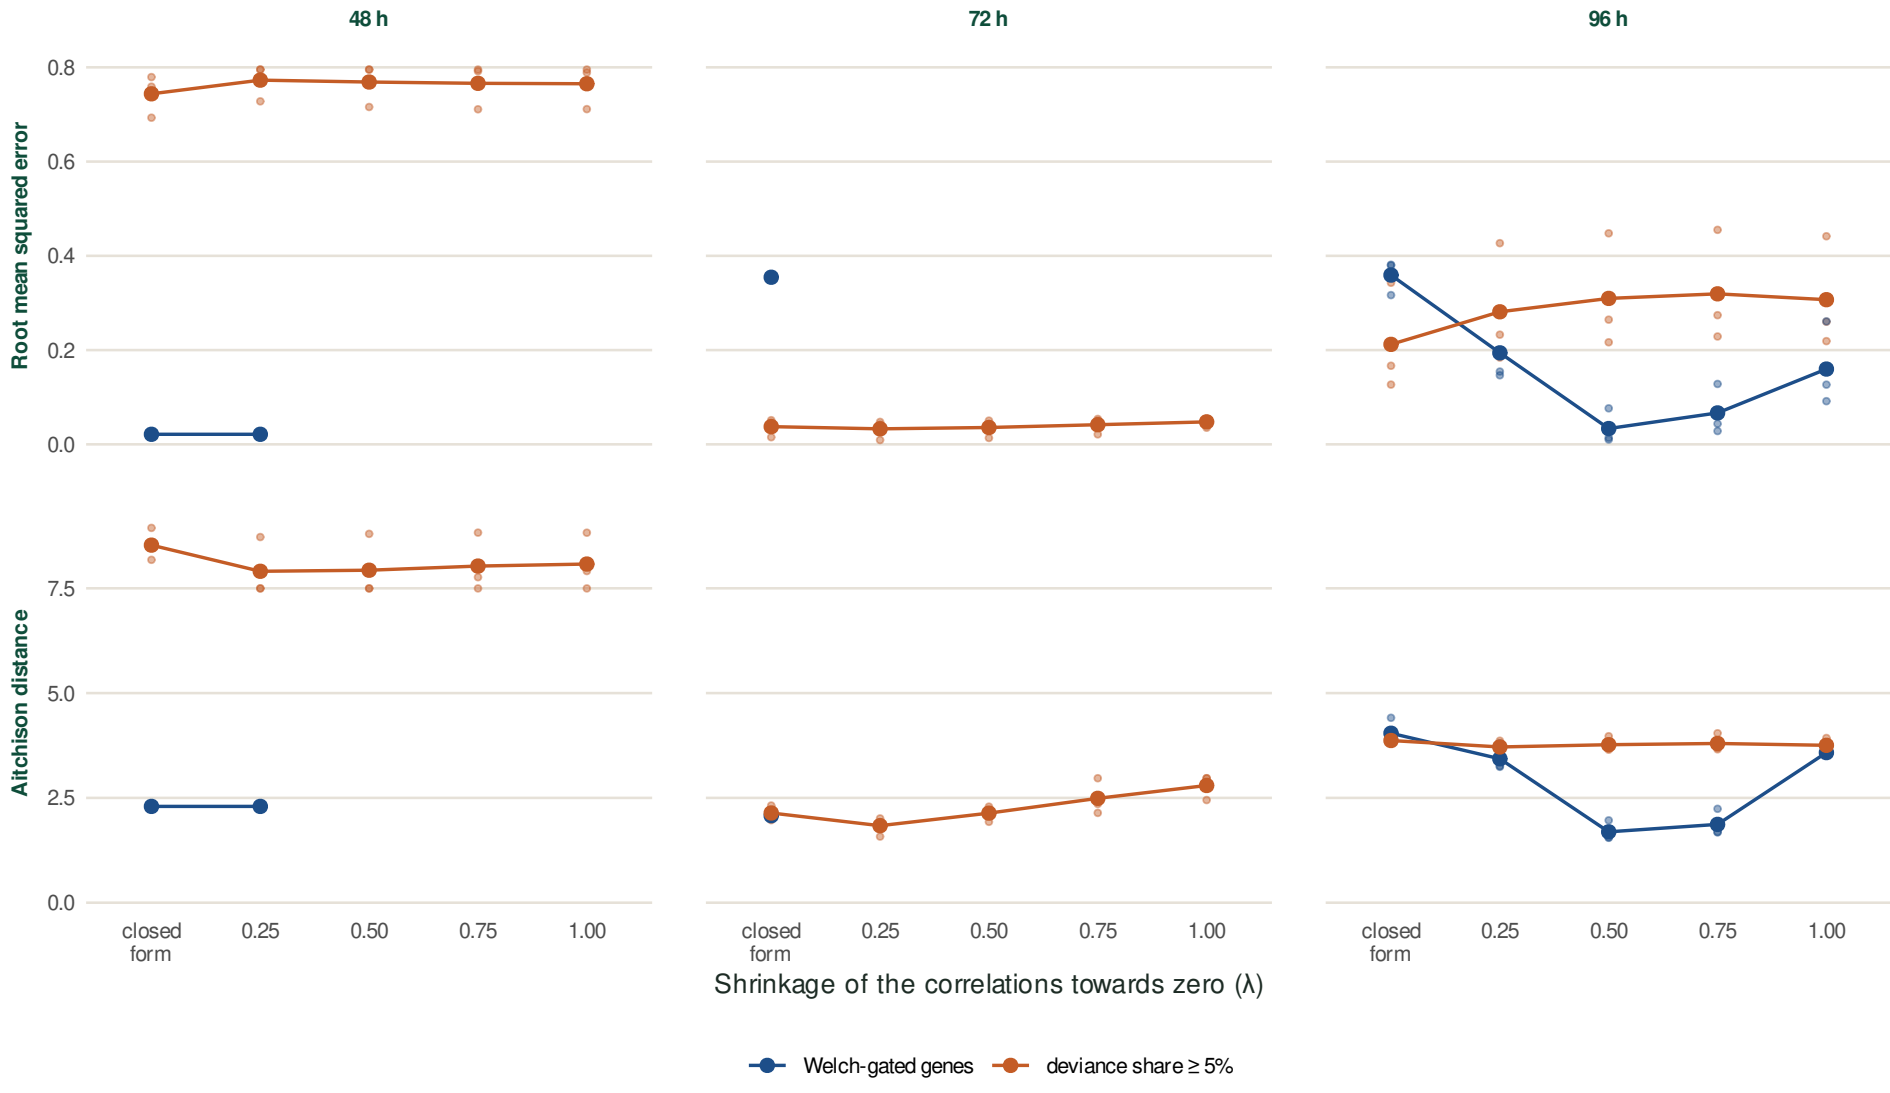
Welch-gated genes, 96 h: RMSE 0.36 at the closed-form λ, 0.03 at 0.5, 0.16 at 1


DeCovarT, raw covariance, L-BFGS-B, bulk as is. Small points: the three standard-Wnt replicates; line: their mean.
The closed-form level differs by cell type (0.006 to 0.74); λ = 1 keeps the variances only.
